

A QUANTUM LEAP FOR ALL CATARACT PATIENTS

The better
monofocal IOL

LENTIS[®] QUANTUM

Dear Patient,

Nowadays, nobody must endure visual impairments due to cataract. Modern ophthalmology has excellent options for removing cataracts quickly, painlessly and permanently.

Treatment with a LENTIS® Quantum intraocular lens (IOL) can achieve a new level of visual comfort that goes beyond a standard monofocal lens solution.

The LENTIS® Quantum offers better vision due to more depth of focus!
For reading and close-up work, you will still need reading glasses.

Discuss with your ophthalmologist, whether the LENTIS® Quantum is the intraocular lens that will benefit you the most!

A blurry street scene illustrating vision with cataracts. In the foreground, a person is riding a bicycle, their form blurred. In the background, another person is walking, and a car is partially visible on the right. The overall image is out of focus, simulating the visual impairment caused by cataracts.

Cataracts

What is that?

Cataract is the clouding of the originally clear lens of the eye, which usually affects both eyes.

It may look like trying to see through fog, which gets thicker over time. Your vision becomes increasingly blurry, and images lose intensity and colour.

The haze over your eyes makes everyday life difficult: activities such as driving a car or watching television become a strain. If the cataract remains untreated, it may lead to complete blindness.

How are cataracts treated?

The only successful treatment option is surgery, whereby the natural lens is removed and replaced by an artificial monofocal intraocular lens.

Cataract surgery is one of the most common operations with over 28 million procedures worldwide each year.

It's a routine operation with a very low complication rate.
